

ADVANCED SQL-RETURN DATA FROM A STORED PROCEDURE GOAL

Exercise 5: Return Data from a Stored Procedure Goal:

Create a stored procedure that returns the total number of employees in a department.

Steps: 1. Define the stored procedure with a parameter for DepartmentID.

2. Write the SQL query to count the number of employees in the specified department.

3. Save the stored procedure by executing the Stored procedure content.

Create Stored Procedure

This procedure returns the total number of employees in a given department.

```
CREATE PROCEDURE sp_GetEmployeeCountByDepartment
    @DepartmentID INT
AS
BEGIN
    SELECT COUNT(*) AS TotalEmployees
    FROM Employees
    WHERE DepartmentID = @DepartmentID;
END;
```

Execute the Stored Procedure

```
EXEC sp_GetEmployeeCountByDepartment @DepartmentID = 1;
```

The stored procedure was saved successfully by executing the CREATE PROCEDURE statement. It can now be called using:

```
EXEC sp_GetEmployeeCountByDepartment @DepartmentID = 1;
```

to return the total number of employees in the specified department.
